

<b>SDG Goal 3</b>	<b>Good health and well-being</b>
<b>SDG Target 3.5</b>	<b>Strengthen the prevention and treatment of substance abuse, including narcotic drug abuse and harmful use of alcohol</b>
<b>SDG Indicator 3.5.2</b>	<b>Alcohol per capita consumption (aged 15 years and older) within a calendar year in litres of pure alcohol</b>
<b>Time series</b>	<b>Alcohol consumption (by UN factors)</b>

## 1. General information on the time series

- Date of national metadata: 21 June 2021
- National data: <http://sdg-indikatoren.de/en/3-5-2/>
- Definition: The time series "alcohol consumption" is presented as the sum of the beverage-specific alcohol consumption (beer, wine, spirits and others) per capita (aged 15 years and older) within the calendar year converted in litres of pure alcohol. Not included is unrecorded consumption of alcohol, such as home or informally produced alcohol or smuggled alcohol. But instead, the consumption of tourists is included. The considered alcoholic beverages are beer, wine, spirits and intermediate products. Consumption is mainly calculated from production, plus imports minus exports. The consumption of beer also comprises beer provided free of charge to brewery employees, but excluding non-alcoholic beer and malt beverages. From wine consumption excluded are wine for distilleries and vinegar production. Intermediate products are fermented products to which distillation alcohol has been added, like sherry, port and madeira. The relevant time period is the consumption within the calendar year. However, for wine it is the period from August to July (wine year).
- Disaggregation: conversion

## 2. Comparison with global metadata

- Date of global metadata: June 2018
- Global metadata: <https://unstats.un.org/sdgs/metadata/files/Metadata-03-05-02.pdf>
- The time series is not compliant with the global metadata, but provides additional information. The global metadata have been changed on 08/06/2018. Since then, the data have to be adjusted for tourist consumption. Due to that change, the data derived by using the conversion by UN factors are not anymore compliant with the global metadata. In addition, intermediate products are considered and unrecorded consumption is missing compared to the global metadata.

## 3. Data description

- The data on beer, sparkling wine, spirits as well as intermediate products consumption were taken from the excise duties statistics of the Federal Statistical Office, while the data on (still) wine consumption is taken from the Federal Ministry of Food and Agriculture. These data on wine consumption are based on the foreign trade statistics as well as the agricultural statistics on wine of the Federal Statistical Office of Germany. Data on spirits consumption are reported directly in litres of pure alcohol. Therefore, a conversion is not required. All the other alcoholic beverages are converted into alcohol content (% alcohol by volume) as follows: beer 5.0 % and wine 12.0 % according to the metadata. For intermediate products an alcohol content of 17.0 % is applied for conversion. The number of population aged 15 years and older (annual average) is derived from the Census 2011 and is annually updated by the Federal Statistical Office (intercensal population updates). Due to changes in tax law, no data was calculated for 2010.

<https://www.bmel-statistik.de/footer/navigation/archiv/statistisches-jahrbuch/>

#### 6. Timeliness and frequency

- Timeliness: Beer: t + 13 months; Spirits: t + 4 months; Sparkling wine and intermediate product: t + 5 months; Wine: t + max. 12 months
- Frequency: Annual

## 7. Calculation method

- Unit of measurement: Litres of pure alcohol per capita
- Calculation method:

$$\text{Alcohol consumption} = \frac{\sum_{i=1}^3 \frac{\text{Cons } i \cdot \text{Alc } i}{100\%} + \text{Spirits (pure alcohol)} [1,000 \text{ hectolitre}]}{\text{Population aged 15 years and older [number]}}$$

Cons 1 = Consumption of Beer [1,000 hectolitre]

Cons 2 = Consumption of Wine and sparkling wine [1,000 hectolitre]

Cons 3 = Consumption of Intermediate products [1,000 hectolitre]

Alc 1 = Alcohol per volume of Beer = 5.0%

Alc 2 = Alcohol per volume of Wine and sparkling wine = 12.0%

Alc 3 = Alcohol per volume of Intermediate products = 17.0%

<b>SDG Goal 3</b>	<b>Good health and well-being</b>
<b>SDG Target 3.5</b>	<b>Strengthen the prevention and treatment of substance abuse, including narcotic drug abuse and harmful use of alcohol</b>
<b>SDG Indicator 3.5.2</b>	<b>Alcohol per capita consumption (aged 15 years and older) within a calendar year in litres of pure alcohol</b>
<b>Time series</b>	<b>Alcohol consumption (by national factors)</b>

### 1. General information on the time series

- Date of national metadata: 21 June 2021
- National data: <http://sdg-indikatoren.de/en/3-5-2/>
- Definition: The time series "alcohol consumption" is presented as the sum of the beverage-specific alcohol consumption (beer, wine, spirits and others) per capita (aged 15 years and older) within the calendar year converted in litres of pure alcohol. Not included is unrecorded consumption of alcohol, such as home or informally produced alcohol or smuggled alcohol. But instead, the consumption of tourists is included. The considered alcoholic beverages are beer, wine, spirits and intermediate products. Consumption is mainly calculated from production, plus imports minus exports. The consumption of beer also comprises beer provided free of charge to brewery employees, but excluding non-alcoholic beer and malt beverages. From wine consumption excluded are wine for distilleries and vinegar production. Intermediate products are fermented products to which distillation alcohol has been added, like sherry, port and madeira. The relevant time period is the consumption within the calendar year. However, for wine it is the period from August to July (wine year).
- Disaggregation: conversion

### 2. Comparison with global metadata

- Date of global metadata: June 2018
- Global metadata: <https://unstats.un.org/sdgs/metadata/files/Metadata-03-05-02.pdf>
- The time series is not compliant with the global metadata, but provides additional information. For calculation of the alcohol consumption in litres of pure alcohol national conversion factors have been used. In addition, intermediate products are considered and unrecorded as well as tourist consumption are missing compared to the global metadata.

### 3. Data description

- The data on beer, sparkling wine, spirits as well as intermediate products consumption were taken from the excise duties statistics of the Federal Statistical Office, while the data on (still) wine consumption is taken from the Federal Ministry of Food and Agriculture. These data on wine consumption are based on the foreign trade statistics as well as the agricultural statistics on wine of the Federal Statistical Office of Germany. Data on spirits consumption are reported directly in litres of pure alcohol. Therefore, a conversion is not required. All the other alcoholic beverages are converted into alcohol content (% alcohol by volume) as follows: beer 4.8 % and wine 11.0 % according to the national factors of the Federal Ministry of Health. For intermediate products an alcohol content of 17.0 % is applied for conversion. The number of population aged 15 years and older (annual average) comes from the Census 2011 and is annually updated by the Federal Statistical Office (intercensal population updates). Due to changes in tax law, no data was calculated for 2010.
